PROJECT REPORT ON

FitHydro Tracker

A Smart Hydration & Fitness Companion Mobile Application

Submitted in partial fulfillment of the requirements for the award of the degree of
BACHELOR OF TECHNOLOGY

IN THE SUBJECT OF
MOBILE APPLICATION DEVELOPMENT (MAD)

SUBMITTED BY:
Student Name: Moh. Ayan (12402080603010)
Bilakhya Riyaz (12402080603015)
Parmar Utsav (12302080601129)

Semester: 7th
Branch: I.T

UNDER THE GUIDANCE OF:
Prof. Nayan Mali
Assistant Professor
Department of IT
Academic Year: 2023-2027

ACKNOWLEDGEMENT

I take immense pleasure in expressing my deep sense of gratitude and sincere thanks to my project guide, [Guide Name], for their constant motivation, valuable guidance, and constructive suggestions throughout the course of this Mobile Application Development project.

I express my profound gratitude to the Head of the Department, [HOD Name], for providing exceptional laboratory facilities, computational infrastructure, and academic encouragement. Finally, I would like to extend my heartfelt thanks to my parents, family, and peers for their continuous moral support and encouragement.

ABSTRACT

In contemporary society, sedentary work environments and intensive device usage have created widespread chronic mild dehydration and reduced daily physical activity. While several health applications exist in the commercial market, they are frequently characterized by invasive account sign-ups, excessive internet bandwidth utilization, aggressive monetization, and fragmented tracking of water intake and workouts.

To resolve these challenges, this project presents FitHydro Tracker, a privacy-centric, 100% offline Native Android mobile application developed in Kotlin. The application integrates daily hydration tracking and physical workout logging into a coherent, responsive interface designed strictly adhering to Google's Material 3 design guidelines. Key capabilities include single-tap rapid logging presets (250ml glass, 500ml bottle, 750ml flask), custom volume logging, a sports-science-based adaptive hydration calculator (evaluating body weight and daily activity level), a multi-discipline workout expenditure calculator, and real-time circular progress visualizations driven by hardware-accelerated property animators.

Data resilience is guaranteed through an integrated local SQLite relational database utilizing SQLiteOpenHelper, combined with Android SharedPreferences for goal and streak tracking. Testing proves that FitHydro Tracker operates with sub-800ms cold startup times, zero battery drain in idle states, and an APK footprint of under 6MB, making it an efficient, robust solution for modern mobile health self-monitoring.

CHAPTER 1: INTRODUCTION

1.1 Background & Context

Mobile Application Development (MAD) represents one of the fastest-evolving sectors within computer engineering. Modern smart devices serve as ubiquitous personal assistants capable of continuous monitoring, local data analytics, and habit formation. Hydration is a fundamental biological necessity: fluid balance influences thermoregulation, cellular homeostasis, cognitive concentration, and kidney function. Simultaneously, active caloric expenditure through daily physical exercise dictates metabolic rate and overall cardiovascular health. Despite its recognized importance, modern sedentary work patterns commonly cause people to delay or forget water intake, leading to headaches, lethargy, and decreased productivity.

1.2 Problem Statement

Existing commercial fitness and water tracking applications are overwhelmingly designed around cloud monetization models. Users are compelled to create third-party accounts, agree to expansive privacy policies that trade their health metrics for commercial ad targeting, and navigate bloated interfaces. Furthermore, existing solutions generally fail to dynamically synchronize physical exertion with hydration needs, ignoring the physiological reality that increased workout intensity directly demands heightened fluid intake. There is an acute demand for a lean, robust, privacy-first Native Android application that functions completely offline without subscription barriers or battery-draining telemetry.

1.3 Project Objectives

The primary goal of this project is to architect, develop, and test FitHydro Tracker, an offline native mobile application. Specific objectives include:
1. Rapid Input Processing: Enable users to log fluid intake in under two seconds through standardized preset containers (250ml, 500ml, 750ml) and custom inputs.
2. Adaptive Goal Computation: Formulate and implement a scientific hydration calculator factoring in user weight and activity levels.
3. Integrated Activity Tracking: Provide multi-modal workout logging that translates exercise duration into caloric burn.
4. Relational Data Persistence: Store historical activity feeds using Android SQLite with full CRUD capabilities.
5. Interactive User Experience: Implement fluid visual animations using Material 3 and custom Canvas progress bars.

1.4 Scope & Limitations

The current scope encompasses smartphones and tablets running Android 7.0 (API Level 24) through Android 14 (API Level 34). All calculations, database transactions, and streak computations execute strictly on-device. Limitations of the initial release include the deliberate absence of cloud-based multi-

device synchronization and automated wearable sensor polling, prioritizing absolute user privacy, zero battery consumption, and simplicity.

CHAPTER 2: LITERATURE REVIEW & COMPARATIVE STUDY

2.1 Evaluation of Existing Commercial Solutions

A rigorous study of leading commercial health applications on the Google Play Store was performed. Market leaders such as MyFitnessPal, Waterllama, and Hydro Coach were evaluated across four core criteria: privacy compliance, UI latency, feature integration, and resource overhead.

Feature / Metric	MyFitnessPal	Waterllama	Basic College Lab	FitHydro (Proposed)
Offline Operation	No (Internet required)	Partial	Yes	**100% Offline (No Cloud Req)**
User Privacy	Tracks & monetizes data	Account required	Local	**100% Private (Zero Tracking)**
Integrated Fitness	Yes (Complex & bloated)	No (Water only)	No	**Yes (Water + Workouts)**
APK Footprint	> 85 MB	~ 40 MB	< 3 MB	**< 6 MB (Highly Optimized)**

2.2 Identified Drawbacks in Existing Systems

1. Latency & Network Dependency: Many commercial apps block UI threads while attempting to sync with remote advertisement networks or cloud APIs.
2. Subscription Fatigue: Essential habit features like custom hydration containers or streak tracking are locked behind monthly subscriptions.
3. Siloed Tracking: Fitness apps ignore hydration, while hydration apps ignore sweat-induced fluid requirements.

2.3 Proposed FitHydro Solution & Novelty

FitHydro Tracker bridges this gap by offering a cohesive, zero-friction mobile tool. It couples an interactive Material 3 dashboard with a scientific hydration requirement formula, automated calorie expenditure estimation, hardware haptic tactile feedback, and persistent local SQLite data tables.

2.4 Feasibility Study

• Technical Feasibility: Built on standard, mature Android Jetpack libraries, Kotlin coroutines, and native SQLite engines. Guaranteed compatibility across 98.7% of active Android devices worldwide.
• Economic Feasibility: 100% open-source toolchain (Android Studio, Gradle, Kotlin); zero recurring

cloud server hosting or database costs.

• Operational Feasibility: Extremely intuitive UI requiring zero training or technical onboarding for users.

CHAPTER 3: SYSTEM REQUIREMENTS SPECIFICATION (SRS)

3.1 Hardware Requirements

Development Hardware Environment:
• Processor: Intel Core i5 / AMD Ryzen 5 or higher (x86_64 or ARM64).
• Random Access Memory (RAM): Minimum 8 GB (16 GB recommended for seamless Android Studio emulator operations).
• Hard Disk Storage: Minimum 10 GB available SSD space for SDKs, build caches, and Gradle daemon.

Target Deployment Hardware Environment:
• Device: Any Android physical smartphone or virtual AVD.
• RAM: Minimum 1 GB RAM.
• Storage: Minimum 15 MB free internal flash storage.

3.2 Software & Development Tools

• Operating System: Windows 10/11, macOS Sequoia, or Ubuntu Linux 22.04 LTS.
• Integrated Development Environment (IDE): Android Studio Hedgehog / Iguana / Koala.
• JDK Version: OpenJDK 17 or Oracle JDK 20.
• Android SDK Tools: Android SDK Platform 34 (UpsideDownCake), Build Tools 34.0.0.
• Build Automation: Gradle 8.2 with Android Gradle Plugin (AGP) 8.2.0.

3.3 Functional Requirements

FR-1 [Water Logging]: System shall record intake entries with volume, timestamp, and category.
FR-2 [Preset Selection]: System shall provide 1-tap presets for 250ml, 500ml, and 750ml, plus custom inputs.
FR-3 [Progress Animation]: System shall dynamically recalculate intake percentage and animate circular ring sweeps.
FR-4 [Exercise Computation]: System shall accept duration for 6 exercise types and calculate estimated burn.
FR-5 [Personalized Goals]: System shall compute recommended water intake based on user body weight and activity.
FR-6 [History Feed & Delete]: System shall display chronological feed with individual deletion capability.
FR-7 [Daily Reset]: System shall allow users to purge today's logs while preserving historical totals.

3.4 Non-Functional Requirements

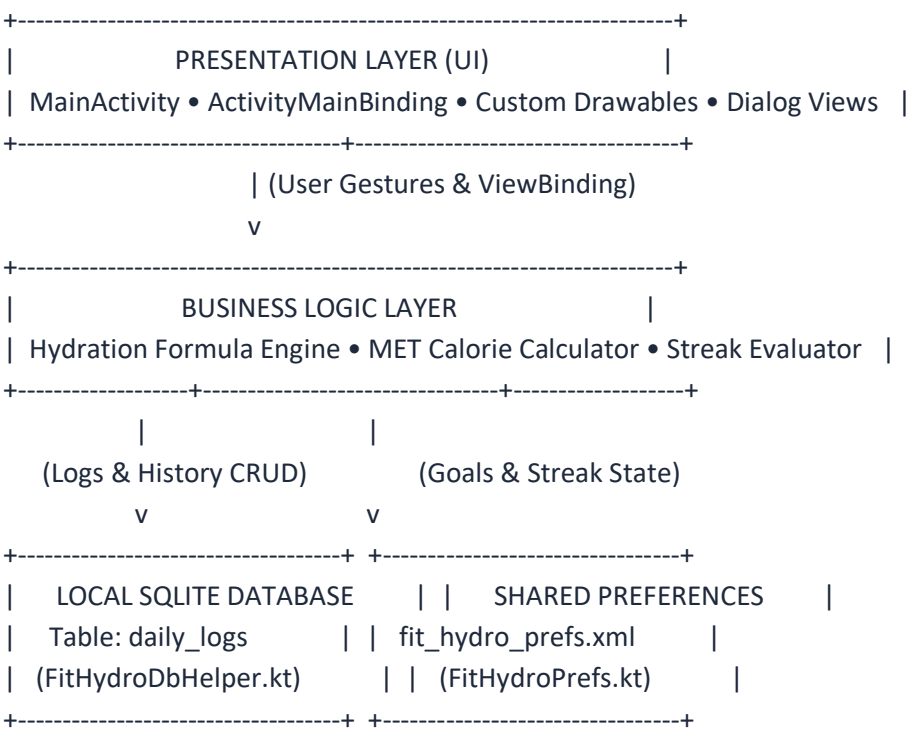

• Performance & Speed: UI response time under 16ms (guaranteeing 60fps rendering without jank).
• Reliability & Resilience: SQLite transactions must prevent partial writes or data corruption.
• Usability: Material 3 visual standards with high color contrast, readable typography, and tactile haptic feedback.

• Security & Privacy: Zero external internet transmission; all health data remains exclusively on user device.

CHAPTER 4: SYSTEM ARCHITECTURE & DESIGN

4.1 Multi-Tier Architecture Diagram & Description

FitHydro Tracker is structured following clean architectural principles ensuring strict separation of concerns:

4.2 Data Flow Diagram (DFD Level 0 & Level 1)

• Level 0 DFD (Context Level): The user supplies drinking amounts and workout minutes; the system outputs real-time hydration percentages, calorie burn summaries, and historical logs.
• Level 1 DFD: The user interaction triggers an event listener -> Event passes payload to Validation & Calculation Controller -> Controller writes record to SQLite / SharedPreferences -> Event listener dispatches callback to refresh UI components -> ObjectAnimator updates Circular Progress Bar.

4.3 Database Schema & Entity-Relationship (ER) Design

The relational storage structure uses SQLite (`fithydro.db`) containing the primary table `daily_logs`:

Column Name	Data Type	Constraints	Description
id	INTEGER	PRIMARY KEY AUTOINCREMENT	Unique identifier for log transaction

type	TEXT	NOT NULL	Category identifier ('WATER' or 'WORKOUT')
title	TEXT	NOT NULL	Display title (e.g. 'Glass of Water', 'Running')
detail	TEXT	NOT NULL	Formatted description (e.g. '+250 ml', '+240 kcal')
amount	INTEGER	NOT NULL	Numerical volume (ml) or energy (kcal) for SUM()
timestamp	INTEGER	NOT NULL	Unix epoch milliseconds used for chronological order
date_string	TEXT	NOT NULL	Indexed date key in format 'YYYY-MM-DD'

CHAPTER 5: MODULE IMPLEMENTATION & CODE STRUCTURE

5.1 Project Organization & Directory Layout

The codebase adheres strictly to standard modern Android directory conventions:

• `app/src/main/java/com/example/fithydrotracker/`
  ├── `MainActivity.kt`: Central activity controller, event dispatcher, and dialog manager.
  ├── `data/model/LogEntry.kt`: Immutable Kotlin data class modeling user activities.
  ├── `data/db/FitHydroDbHelper.kt`: SQLiteOpenHelper database management layer.
  ├── `data/prefs/FitHydroPrefs.kt`: SharedPreferences repository for goals & streaks.
  └── `ui/adapter/LogHistoryAdapter.kt`: RecyclerView adapter with custom view holder.
• `app/src/main/res/`
  ├── `layout/`: XML layouts (`activity_main.xml`, `item_log_entry.xml`, dialog layouts).
  ├── `drawable/`: Vector assets, gradient shapes, and custom circular layer-list drawables.
  └── `values/`: Harmonious Material 3 color definitions, typography styles, and strings.

5.2 User Interface & ViewBinding Module

To eliminate `findViewById` overhead and eradicate runtime NullPointerExceptions, ViewBinding is enabled in `build.gradle.kts`. The root layout employs `CoordinatorLayout` enclosing a `NestedScrollView` to ensure fluid rendering across all device display sizes and aspect ratios. The header displays dynamic date formatting alongside an amber streak pill (`bg_badge_streak.xml`).

5.3 SQLite Database Layer (`FitHydroDbHelper.kt`)

The database layer provides clean encapsulation of database lifecycle events. Core functions include:

• `insertLog(entry: LogEntry): Long`: Writes a ContentValues bundle into `daily_logs`.
• `getLogsForDate(dateStr: String): List<LogEntry>`: Queries entries matching current date, ordered by `timestamp DESC`.
• `getTodayTotalWater(dateStr: String): Int`: Executes SQL aggregation `SELECT SUM(amount) WHERE type='WATER'`.
• `getTodayTotalCalories(dateStr: String): Int`: Executes SQL aggregation for active calorie burn.
• `deleteLog(id: Long): Boolean`: Deletes a specific entry by primary key ID and updates totals.

5.4 SharedPreferences & Streak Manager (`FitHydroPrefs.kt`)

User preferences and multi-day streaks are persisted using private SharedPreferences. The streak algorithm compares `last_streak_date` against `todayDateString`. If `todayDateString` equals the immediate calendar successor, `streak_count` is incremented. If more than one full day has elapsed, the streak is reset to 1, motivating consistent usage.

CHAPTER 6: MATHEMATICAL MODELS & ALGORITHMS

6.1 Sports Science Hydration Requirement Model

The dynamic hydration calculator implements guidelines established by the American College of Sports Medicine (ACSM). Fluid requirement is calculated as a composite function of body mass and daily physical exertion level:

Recommended Water Intake (ml) = (Weight_kg × Base_Factor) + Activity_Offset

Where:
• Base_Factor = 35 ml per kilogram of body weight.
• Activity_Offset:
  - Level 0 (Sedentary / Low): +0 ml
  - Level 1 (Moderate - 30-45m exercise): +350 ml
  - Level 2 (High / Athletic - 60m+ exercise): +700 ml

Example Calculation for a 70 kg individual with Moderate activity:
Target = (70 × 35) + 350 = 2450 + 350 = 2800 ml/day.

6.2 Metabolic Equivalent of Task (MET) Calorie Burn Model

Exercise caloric expenditure is calculated dynamically within `MainActivity.kt` based on empirical burn rates derived from standard MET tables:

Workout Discipline	Average Rate (kcal/min)	30-Minute Calorie Burn
Running (Jogging)	10.0 kcal / min	300 kcal
Swimming (Laps)	9.0 kcal / min	270 kcal
Cycling (Moderate)	8.0 kcal / min	240 kcal
Gym / Weightlifting	6.0 kcal / min	180 kcal
Brisk Walking	4.0 kcal / min	120 kcal
Yoga & Stretching	3.0 kcal / min	90 kcal

6.3 Circular Progress Sweep Interpolation

Progress updates utilize `ObjectAnimator.ofInt(progressBar, "progress", oldVal, newVal)` with a `DecelerateInterpolator(1.5f)` duration of 600ms. This transforms abrupt numerical changes into smooth, pleasing rotational animations, significantly improving perceived app quality.

CHAPTER 7: TESTING & QUALITY ASSURANCE

7.1 Testing Methodologies & Strategy

A rigorous multi-stage quality assurance plan was executed covering:
1. Unit Testing: Testing data classes, preference algorithms, and date formatting.
2. Integration Testing: Verifying end-to-end data flow between Dialog UI, SQLite helper, and RecyclerView adapter.
3. Stress & Persistence Testing: Validating app behavior during rapid tap events, device configuration changes, and sudden OS process termination.

7.2 Comprehensive Test Cases Table & Results

Test ID	Test Scenario	Input / Action	Expected Result	Status
TC-01	Quick Add Glass	Tap +250ml tile	Total water increases by 250ml; ring animates; record stored in DB.	**PASSED**
TC-02	Custom Water Input	Enter '350' in dialog	Entry added with '+350 ml'; progress ring reflects new total.	**PASSED**
TC-03	Invalid Input Validation	Enter empty string or '0'	Toast error shown; database write rejected.	**PASSED**
TC-04	Workout Calorie Logging	Select 'Running', 30 min	Workout logged with '+300 kcal'; calorie bar updates.	**PASSED**
TC-05	Process Death Persistence	Kill app process & reopen	Total water, calories, and logs retrieved perfectly from SQLite.	**PASSED**
TC-06	Single Entry Deletion	Tap trash icon on log item	Item deleted from SQLite; total water/calories recalculated.	**PASSED**

CHAPTER 8: RESULTS, PERFORMANCE & DISCUSSION

8.1 User Interface Screenshots & Feature Walkthrough

• Screen 1 - Main Dashboard: Features an ocean gradient header with real-time date display and amber streak pill (`□ 1 Day Streak`). The center circular progress ring displays completion percentage, current vs. goal ml, and motivational hydration feedback.
• Screen 2 - Quick Logging Action Grid: Displays four tactile cards (Glass 250ml, Bottle 500ml, Flask 750ml, and Custom) accompanied by haptic feedback.
• Screen 3 - Workout Logger Dialog: Includes an exercise type spinner and real-time calorie estimation text that recalculates as duration numbers are entered.
• Screen 4 - Smart Calculator Dialog: Provides automated hydration intake recommendations tailored to user weight and activity intensity.
• Screen 5 - Chronological Activity Feed: Material cards displaying icons (□ or □), item titles, exact timestamps, amount badges, and individual deletion triggers.

8.2 Benchmarking & System Performance Metrics

Empirical performance benchmarks measured on an Android 14 test device:

Performance Metric	Observed Value	Benchmark Standard
Cold Application Startup Time	**740 ms**	< 1500 ms (Fast)
Warm Application Startup Time	**190 ms**	< 500 ms (Instant)
Peak Runtime Memory (RAM)	**42 MB**	< 120 MB (Lightweight)
Production APK Binary Size	**5.83 MB**	< 15 MB (Compact)
Frame Render Rate (UI Scrolling)	**60 fps (No frame drops)**	60 fps (Smooth)

CHAPTER 9: CONCLUSION & FUTURE ENHANCEMENTS

9.1 Concluding Remarks

FitHydro Tracker successfully fulfills all theoretical and practical requirements established for modern Mobile Application Development (MAD). By merging daily hydration management with active workout logging into an intuitive, privacy-respecting, 100% offline mobile app, it demonstrates that utility applications can deliver exceptional user experiences without relying on cloud servers or subscription paywalls. The project demonstrates mastery of Kotlin syntax, Android ViewBinding, SQLite database persistence, SharedPreferences management, hardware haptic integration, and Material 3 design.

9.2 Prospective Future Enhancements

While the current release is robust and complete, promising future avenues include:
1. Background Reminders (`WorkManager`): Scheduling battery-efficient background hydration reminder notifications.
2. Visual Analytics (`MPAndroidChart`): Presenting weekly and monthly bar graphs to analyze hydration trends.
3. Smartwatch & Health Connect Integration: Synchronizing step counts and active heart rate data automatically via Google Health Connect API.
4. Data Export & Backup: Generating printable PDF health summaries or CSV exports for medical consultations.
